Linking Garden Tourism with QoL Domains

Claudia Bauer-Krösbacher IMC-FH Krems, Austria claudia.kroesbacher@fh-krems.ac.at

Session: QoL from the Perspective of Tourists

Keywords: garden tourism, botanical gardens, cultural tourism, demographics, cluster analysis

Structured abstract:

Purpose of the study: The study aims at profiling the garden tourist, to reveal how how visitors experience these open spaces emotionally and how these aspects can be linked to elements of QoL (e.g. social relationships, emotional wellbeing, etc. as suggested by Kovács et al. in Smith and Puczkó 2006, p. 45).

Design/methodology/approach: A comprehensive literature review forms the basis of the study. A garden visitor survey (n=1190) was conducted at four different heritage gardens in Europe including a garden in Bulgaria and Romania in August 2011. The findings of this study will be connected with domains and specific elements of QoL.

Findings: The findings reveal that garden tourists are not a uniform market. There are different types of garden tourists depending on their motivation and experience sought. In conclusion on the demographic characteristics of the respondents it can be said that the individual sites attract different types of visitors regarding their demographic characteristics. However, for all visitors experiencing a garden can be regarded as an important social experience. Regarding their emotional experience it can be said that gardens have the potential to foster emotional wellbeing. The findings suggest that visiting gardes can be seen as an activity that has the potential to raise people's Ool..

Originality/value: The contribution of this study lies particularly in the analysis of garden tourists characteristics and experiences and a discussion how garden experiences contribbute to QoL. Overall, little is known about this niche market.

Research limitations/implications: The presented ideas and findings can be used as a basis for qualitative or quantitative studies in both areas, garden tourism and QoL.

Practical implications: The findings are important for further product development in the area of garden tourism and designing experiences for their visitors. Gardens have the potential to become significant tourist attractions.

Keeping mental budget: visitors' spending at a Christmas market

Juan Gabriel Brida Free University of Bozen-Bolzano, Italy juangabriel.brida@unibz.it

Marta Disegna Free University of Bozen-Bolzano, Italy marta.disegna@unibz.it

Oksana Tokarchuk Free University of Bozen-Bolzano, Italy oksana.tokarchuk@unibz.it

Session: QoL from the Perspective of Tourists

Keywords: visitor's spending, mental budgets, Christmas market

Structured abstract:

Purpose of the study: Research in consumer behavior demonstrates that people tend to allocate financial resources to different categories, mental budgets that serve consumers as a tool of self-control against unplanned spending. In the present study we explore the notion of mental budgets applied to shopping at Christmas market.

Design/methodology/approach: Data collected on 899 visitors to Merano Christmas Market in December 2011 was used. The main focuses of the study were finding the profile of visitors that planned the expenditure at the Christmas market and the determinants of how much is allocated to this end. Furthermore, the matching between actual expenditure and mental budget is investigated. An appropriate econometric model is used.

Findings: Our data suggests that visitors of Christmas Market plan to spend more than they actually spend. This may be explained by the fact that consumer's spending expectations for the shopping trip include room for unplanned purchases (Stilley et al., 2010) but these unplanned purchases are not done. The survey provides some suggestion on why visitors may not be spending as much as they planned. Many visitors blame the prices to be too high. Others suggest that the stands are similar compared to other cities, that there is too little variety among offered products.

Originality/value: Research on mental accounts is mainly concerned with the fact that resources with different labels are spent differently based on the label name (Sheffrin and Thaler, 1988). In consumer research mental budgeting has been applied to explain unplanned purchases in the field of grocery shopping. Christmas Markets are non-frequent and unfamiliar shopping activity. Our research extends the concept of mental budgeting to non-frequent and nondurable purchases.

Research limitations/implications: The main limitations are that the analysis is based on a non-random sample and only one Italian Christmas Market was considered. Thus, future study will be required in other Christmas Markets.

Practical implications: This research explores potential willingness to spend of consumers and confronts it with actual expenditure. This would help practitioners investigate whether they reach their potential or whether there is something to improve.

Repeat Visitors to Museums: Does Their Typology Matter?

Juan Gabriel Brida Free University of Bozen-Bolzano, Italy JuanGabriel.Brida@unibz.it

Marta Disegna Free University of Bozen-Bolzano, Italy Marta.Disegna@unibz.it

Raffaele Scuderi Free University of Bozen-Bolzano, Italy Raffaele.Scuderi@unibz.it

Session: QoL from the Perspective of Tourism Industry

Keywords: Repeat visit, Count data models

Structured abstract:

Stimulating the repeat visit and improving the loyalty of tourists is one of the most important aims of tourist operators. This statement is also valid for museums, whose positive impact on local communities, societies and economies has been made clear by a vast literature. Nevertheless, to the best knowledge of the authors only one paper can be found in the literature analysing the relationship between the repeat visitation and a set of factors (Brida, Meleddu & Pulina, 2012).

The earlier work of Gitelson & Crompton (1984) defines the repeat visitation as "A trip to a primary destination which previously had been visited for any purpose by the respondent". This definition is operationalized in the literature via two different approaches.

The first one makes use of a backward perspective of revealed preferences and asks the interviewee whether she has already been to the destination, and/or how many times she has been to a place. The issue of the analysis of the number of past trips has been widely explored by the literature on the travel cost analysis, which makes use of count data model in order to estimate demand functions. Here the expected value of the number of trips per year is seen as function of travel costs to site, plus a set of demand shift variables (e.g., income, travel costs to substitute sites) – see the early contribution of Hellerstein (1991).

The second approach (forward) is based on the theory of planned behaviour (Ajzen, 1991), which postulates a link between attitudes and behaviour. Researchers using this approach analyse the willingness to revisit the destination (stated preferences), by asking the visitor whether she will return in the future, or the willingness to return measured by a Likert scale. Nevertheless a recent contribution by McKercher and Tse (2012) shows that no statistically significant correlation is found between intention and actual repeat visitation rates, by using data from many tourist markets.

Objectives

This paper analyses the repeat visitation in museums by making use of data surveyed through a backward approach. The number of times the visitor has been to the museum is asked and analysed through three different typologies of econometric models: Logit, Zero-Inflated Poisson, and Count Quantile.

Each model is addressed to testing and enhancing peculiar information regarding the influence of a set of covariates on the repeat visit.

Research question(s) and/or Hypothesis/es

Repeat visitation in a destination is one of the main objectives of tourism policies, and a key factor for sustaining tourism development. Knowing the factors that significantly affect the visitor's loyalty allows to address the actions of the operators of the tourist market.

- What are these factors?
- What is their weight in determining the loyal visit?
- Which aspect of repeat visitation do they influence?
- What are the policy indications that emerge?

Method

An ad-hoc survey was conducted from June to September 2011 among the visitors of the principal museums of the two provinces of the Trentino-Alto Adige region (Bolzano and Trento), Italy: the South Tyrol Museum of Archeology (ÖTZI), located in Bolzano, hosting the permanent exhibition of the "Iceman" Ötzi, and the Museum of Modern and Contemporaneous Art of Trento and Rovereto (MART). The questionnaires were self-administrated and a total of 1,284 interviews, divided almost equally between the two museums analysed, are successfully collected.

Three different econometric models are tested in order to enhance three different aspects of the information on the repeat visit, given a set of covariates:

- Logit, in order to analyse the influence on the probability of being a repeat visitor;
- Zero-Inflated Poisson (ZIP), for the sake of studying the influence of the covariates on the number of visits, by putting into account properly the high number of people who declared to be a first-time visitor;
- Count Quantile regression, whose scope is to detect the effect of the variables on different portions, i.e. quantiles, of the distribution of the number of visits.

A set of covariates regarding visit-related, trip-related, socio-economic and demographic information is tested.

Results

These are the main indications on repeat visitors (RV) that emerge from the models.

- They are more likely to revisit MART than ÖTZI museum.
- They show a higher attention to cultural aspects.
- Repeat visit happens less frequently during weekends. It is not necessarily done either for the temporary and the permanent collection.
- They take their families or friends with them, and not necessarily do the visit with children or in group.
- They do not want to learn something new or satisfy their curiosity.
- They consider the museum only as a unique attraction in the world only if they visit it for the first time, with respect to all other repeat visitors.
- They live near the areas of the museums and they are more frequently Italian; they are not married especially if they have a lower revisit rate; first time visitors are mainly women.
- Age, education, income, many motivations and occupation are not significant.

Conclusions and Implications

From the analysis of the literature, it emerges the necessity to analyse the repeat visitation via the number of the past visits, rather than the intention to revisit.

In order to enhance the repeat visitation of museums, policy indications that emerge are the following ones.

- Promote cultural events during the week rather than weekends
- Propose cultural events for children
- Give greater attention to tourists that come from far places and have a few time at their disposal

Museums-related culture: it is not merely related to "learning something" and "satisfying curiosity": it appears to be much more!

Tourists' Perception of and Well-being in Destination Settings. A Gestalt View

Alexandra Brunner-Sperdin Innsbruck University, Austria alexandra.sperdin@uibk.ac.at

Bernd Reitsamer Innsbruck University, Austria bernd.reitsamer@uibk.ac.at

Session: QoL from the Perspective of Tourists

Keywords: Gestalt Approach, Well-being, Satisfaction, Destination Attractiveness

Structured abstract:

Purpose of the study: We develop and test a model of holistic tourists' perception of destination settings evaluating the impact of destination attributes on well-being and satisfaction. In line with Kaplan and Kaplan (1989) we argue that sense-making and exploratory destination attributes elicit well-being and thus influence visitors' perception.

Design/methodology/approach: The study was conducted as a self-administered survey. A sample of 391 respondents was obtained. Respondents of two holiday destinations in Austria assessed their perceptions of various destination attributes (i.e. their feelings and cognitive evaluations) at the moment of participation. Hypotheses were tested through structural equation modelling using Mplus. All fit indices were within acceptable ranges of global and model fit criteria.

Findings: Regarding exploratory attributes, in particular the local scenery and a supply of diverse experiential opportunities (education, entertainment, aesthetics, and escapism) positively contribute to travellers' well-being and satisfaction. An integrated view of these two staging components leads to fruitful implications for DMOs. Findings within the sense-making dimension suggest that especially infrastructure, made up of a destination's supporting services, its cleanliness, restaurants and lodging opportunities, significantly influences tourists' perception of well-being and satisfaction.

Results indicate that tourists perceive destination settings holistically and will report higher levels of psychological well-being and satisfaction if destinations emphasize an adequate combination of sense-making and exploratory attributes.

Originality/value: We address environmental literature on place perception, highlighting Kaplan and Kaplan's model of landscape preference. They suggest concepts of sense-making (refers to concern of comprehension) and involvement (concern to figure out, to learn, or to be stimulated). Linking them to the concept of destination attractiveness we state that both sense-making and exploratory dimensions perceived as a holistic bundle of offerings will enable tourists' well-being and to facilitate a satisfying experience.

Research limitations/implications: The study is restricted to a setting of two destinations. Reliable scales properly measuring some of the investigated constructs remain limited. Our understanding of tourist well-being needs to be refined, as several distinct definitions exist.

Practical implications: Sense making and exploratory facilities provide the foundation for destination attractiveness and DMOs can thus increase a destination's attractiveness by strategically planning the provision of supporting services and facilities as well as the experiential offerings.

How to enhance the quality of tour operator journey into wine regions - an analysis of desired components from a customer perspective

Axel Dreyer Hochschule Harz, Germany prof.dreyer@t-online.de

Juliane Ratz Hochschule Harz, Germany jratz@hs-harz.de

Session: QoL and Gourmet Tourism

Keywords: tour operator, wine regions, customer expectations, bus tours, wine tours

Structured abstract:

Purpose of the study: Food and beverage is strongly related to the personally experienced quality of life. In example, wine is considered a life-style product. To discover and consume wine on culinary and wine trips in its terroir gains rising popularity and allows visitors an authentic experience of the regional culture.

In times of increasing competition in the segment of tour operators it is necessary to know detailed customer expectations for a target-oriented product design. One part of the study was to query the expectations of wine-interested travelers concerning the most important components of journeys into wine regions. So recommendations for future product design can be derived.

Design/methodology/approach: In spring a combination of personal and online surveys with the same questionnaire took place. The sample consisted of 191 fully completed questionnaires filled in by people with a general interest in wine. A uniform gender and age distribution among respondents was reached.

Locations for the survey were specialized wine stores as well as wine divisions in supermarkets in Germany. The link to the online survey was placed in social networks (e. g. wine and food oriented networks) and on websites of daily newspapers and mail-order houses. The focus lay on the German audience, but nonetheless French people (n=27) were questioned to discover differences.

Findings: More than 75% of the respondents are interested in wine journeys, which should be short trips (2-4 days). This fits the general trend of shorter but more frequent (e.g. second and third trips) during the year. The majority prefers individual journeys, so tour operators need to adapt. One essential element of journeys into wine regions named by the respondents are wine tastings followed by visits of wine cellars. Furthermore already visited and prospective interesting wine regions were questioned. Here constancy concerning already visited regions and potential travel regions is visible. First findings seam to confirm that wine journeys are a relatively stable segment. Originality/value:

Wine journeys and trips through culinary delights represent a significant segment for future tourism, because they follow the trend of increasing pleasure orientation in our society. Research limitations/implications: Over all people from the middle of Germany has participated in the survey. For presentable statements it would be advantageous to carry out the survey in other regions. Even though an even distribution of gender and age was reached, the sample cannot be considered representative for the German market.

Practical implications: Customer expectations and trends concerning the future selection of travel components in the segment of wine tourism can be worked out through the survey. Compared with the increasing relevance on the tourism market only few offers of wine tours by tour operators exist. This study provides information about essential components of wine journeys and helps tour operators to improve their offers and to compete with individual travelling.

Helping the growth of quality of life-based innovation opportunities in rural areas. 'Albergo diffuso' as best practice

Maurizio Droli University of Udine, Italy maurizio.droli@uniud.it

Giancarlo Dall'Ara CEO GDA consulting firm, Italy giancarlo.dallara@gmail.com

Valeria Pecorelli University of Milano – Bicocca, Italy valeria.pecorelli@unimib.it

Session: QoL and Rural Tourism

Keywords: health, quality of life, natural resource-based theory, innovation opportunity, management

Structured abstract:

Purpose of the study: The 'Albergo Diffuso' is a particular kind of hotel conceived to provide tourism experiences based on local community quality of life and awarded by the UNDP for its sustainability. This paper presents the best practices developed by these hotels to produce process and product innovations.

Design/methodology/approach: the study was concentrated on the issue of innovation management and was conducted through the participant observation. M. Droli has started collecting the best practices data since 2006 (4 firms). In 2011, the study involved 63 firms that are members of the national association of alberghi diffusi among 100 ADs recorded in the same year. Currently, we are implementing a plan to collect new best practices examples.

Findings: the 12 most recurrent groups of best practices in innovation opportunity management issues (alertness, awareness, attractiveness, assessment, adaptation, etc); (b) the corresponding first set of best practices such as awareness: balancing the expectation of success putting at the basis of the innovation opportunity competitive advantages as our 'time luxuries' (Enzensberger, 1999; De Masi, 2004) such as more relaxing life, wider living spaces, silence, etc; and (c) models to facilitate innovations.

Originality/value: we have observed environmental medicine research findings through the natural resource-based theory of the firm. These studies indicate -as mentioned before - QOL-based luxuries represent barriers at the entrance for those tourism firms placed in areas where these resources are scarce (e.g. urban areas). Rural communities therefore have a competitive position- known as rural advantage- that can be better exploited.

Research limitations/implications: "the scarcity of quantitative data and lack the cognitive nature of quality of life were two of the main limitations. The main implication consisted perhaps in the possibility to investigate smaller, but dynamic and globally-influent innovations."

Practical implications: we'll discuss new possibilities to increase the attractiveness of tourism firms operating in rural areas, to produce new rents e.g. from 'delta-silence' through dynamic packaging and to create occupation and preserve resources following 'virtuous' processes.

Holidays, Social Relationships and Happiness: a Case Study

Paolo Figini University of Bologna, Italy paolo.figini@unibo.it

Session: Social Relationships and Gamification

Keywords: Happiness, Holiday, Subjective well-being, Tourism, Quality of Life

Structured abstract:

Purpose of the study: Building upon a recent strand of literature, the paper analyzes the relationship between tourism and happiness, by focusing on one under-investigated channel of transmission: the enhancement of social relations during the holiday. These issues are addressed in a pre-test/post-test design study.

Design/methodology/approach: The self-perception of happiness before and after the holiday is investigated through a questionnaire submitted to a sample of the population. The case-study is Rimini. The reported values represent the affective dimension of happiness, measured using an Affect-Balance-Score. The impact on happiness of ordinary social relationships (with friends, partners and relatives) and special relationships while on holiday (with travel party, residents, holiday-makers) is carefully assessed.

Findings: Data are currently being processed. About 600 interviews (around 300 pre-trip and 300 post-trip questionnaires) are collected. The level of individuals' happiness in the pre- and post-trip condition is assessed to check whether there is any significant difference; moreover, we evaluate the impact of other variables such as stress, socio-economic condition, length of holiday and time elapsed after returning from holiday on post-trip happiness. Finally, the influence of social relationships on happiness is assessed.

Originality/value: This paper adds to the previous literature in three respects. Firstly, this is a pioneer study for Italy on the importance of holidays on individuals' happiness. Secondly, new variables (the extent of social relationships and the type of holiday) are investigated, compared to previous research. Finally, the anticipation effect, that generally plays an important role in pre-trip happiness, is isolated and excluded from the research.

Research limitations/implications: As any case-study, the findings refer to the investigated population. Secondly, the level of happiness of non-vacationers is excluded. Thirdly, the level of happiness during the holiday experience is not considered.

Practical implications: If time spent in personal relationships affects happiness, there are important implications for tourism managers. Not only the destination management should guarantee a stress-free holiday, but also create the conditions for enhancing socialization.

Scuba Diving: A life risking or a quality of life enhacing experience?

Galia Fuchs
Ben-Gurion University, Israel
galiaf@som.bgu.ac.il

Ari Reichel Ben-Gurion University, Israel arier@som.bqu.ac.il

Amir Shani Ben-Gurion University, Israel shaniam@som.bgu.ac.il

Session: QoL from the Perspective of Tourists

Keywords: quality of life, risk, Scuba Diving, adventure tourism

Structured abstract:

Purpose of the study: This exploratory study attempts to examine risk perceptions and experiences in the context of Scuba divers, as a sub-set of adventure tourism. The main risk question relates to the dilemma if it is life risking experience or a quality of life factor?

Design/methodology/approach: The study is based on open ended interviews with experiences Scuba divers. Seventeen Scuba divers were interviewed by two of the authors mainly in various places over Israel. Most of the interviewees were identified via the snow- ball sampling technique. Most of the questions focused on the "general experience of scuba diving", their motivation, risk feelings, risk control elements, and risk reduction means.

Findings: 1. The search for Quality of Life -"Nirvana" -major aspects are: relaxation, serenity, Yoga, meditation freedom and escape from daily worries.2. Motives include: "Dream of my childhood", "A journey into the self, learning how to behave rationally and calmly in a strange, foreign environment".3. Risk is a major component of the diving experience. Yet, it is carefully masked under a strong wish for improving one's quality of life by sensations of serenity, relaxation ("Nirvana") and the utilization of protective procedures.

Originality/value: Allman et al. (2009) maintain that risk is a means of becoming positively transformed, which is apparently essential to adventure seekers quality of life. In other words, extreme sport participants purposefully take risks and are transformed by the common realization of humility and true courage. Our study reveals that a supposedly highly risky sports turns out to be a means for achieving quality of life and "Nirvana".

Research limitations/implications: The study raises the possibility that risk is being commodified in order to market quality of life to masses of tourists.

The sample's small size and its snow-balling methods could limit the study's generalizability.

Practical implications: Marketing scuba diving as a mixed experience of life risking experience with quality of life could be somewhat controversial, yet may attract the relevant segment by catering to their needs.

The Sacred and Profane of Remembrance Tourism; Lest We Forget

Martin McCarthy Edith Cowan University, Australia m.maccarthy@ecu.edu.au

Stephen Fanning Edith Cowan University, Australia s.fanning@ecu.edu.au

Martin O'Neill Auburn University, USA ONEILM1@auburn.edu

Session: QoL from the Perspective of Tourist

Keywords: Sacred, Profane, Pilgrimage, Normandy, Tourism

Structured abstract:

Purpose of the study: The goal of the project was to elicit the feelings, attitudes and emotional impressions of those visiting the touristified museums and allied iconic sites associated WWII landings in the Normandy/Caen region of France.

Design/methodology/approach: Given the purpose of the project and the nature of the expected data, qualitative methods derived from an interpretivistic paradigm were used. The combined techniques of photo elicitation, participant observation, introspection, informal and group interviews were used to derive a rich complimentary data set. The data were then ordered into themes and interpreted in light of two seminal consumer behaviour models.

Findings: The findings included 604 photos combined from five experienced academics travelling in concert from site to site, mimicking the pilgrimage of predominantly elderly tourists. Informal interviews were conducted at six museums, three gun batteries, two landing sites and an iconic building/questhouse.

The a-priori hypothesis revolved around the notion of spiritual tourism, and related to this the notion of self-definition gained from experiential tourism. Also related is the notion of the Extended-Self (Belk, 1988); how we derive a sense of individuation from connection with things, people and places of importance. The findings are consistent with the a-priory hypothesis.

Originality/value: This study applying the notion of sacred consumption to the Normandy tourist pilgrimage is unique. While there are indiviudal cases in the literature exploring the spiritual notion of tourism the secular consumer behaviour application of sacredness of a tourist pilgrimage that de-emphasises religion, while emphasising experiential gain, self-definition and perceptions of service encounter are noticeably absent. Both facets represent an addition to the spiritual notion of tourism.

Research limitations/implications: The results suggest a dichotomy that mirrors Belk et al 1989 'Sacred and Profane' model. Some sites evoke a sense of respect, reflection and gravitas, while others are deemed holistically profane and kitsch.

Practical implications: The Normandy sites have deep spiritual significance to many tourists/pilgrims. To those who manage, control and derive an income from these sites these findings can assist in improving the experience they are arguably responsible for.

Agri-tourism and land use: an evaluation in Veneto and Friuli Venezia Giulia (Italy)

Francesco Marangon University of Udine, Italy marangon@uniud.it

Tiziano Tempesta University of Padova, Italy tiziano.tempesta@unipd.it

Luca Cecchin University of Padova, Italy *luca.cecchin@unipd.it*

Daniel Vecchiato University of Padova, Italy daniel.vecchiato@unipd.it

Stefania Troiano
University of Udine, Italy
troiano@uniud.it

Session: QoL and Rural Tourism

Keywords: agri-tourism, land use, landscape

Structured abstract:

Purpose of the study: The aim of the study is to identify the relationship between agri-tourism overnight stay offer and some characteristics of the territory. To this purpose we analysed some provinces of Veneto (Treviso, Venezia and Padova) and Friuli Venezia Giulia (Gorizia, Pordenone and Udine) regions in Italy.

Design/methodology/approach: For each municipality it was found the number of agri-tourism farms, rooms and beds. Some information concerning the characteristics of land use was also detected mainly using the data obtained from the Census of agriculture and Corine Land Cover 2006 software. An index of agri-tourism offer was constructed. Through stepwise regression were selected variables that affect the supply of accommodation in agri-tourisms.

Findings: The data analysis has revealed that the offer of accommodation by an agri-tourism farm seems to be primarily related to agricultural activities, while some features related to the use of urban land are much less important. In the selected model, which has a good ability to interpret data (r correct = 0.70), there are four independent variables: the percentage of land area occupied by vineyards and orchards, the percentage of farms with a worker that has received further training, the percentage of the area occupied by forests and the percentage of the area occupied by non-cultivated land.

Originality/value: The studies carried out with the aim of pointing out the relationships among land use, landscape and agri-tourism in Italy are a few. In this study we highlight that there are two distinct components that influence the development of the agri-tourism farm: the supply of quality agricultural products and the presence of scenic beauties. However investment in human capital may be a strategic variable for the diffusion of agri-tourism.

Research limitations/implications: The level of data analysis is rather aggregated and the territorial unit we considered is rather composite. Therefore, the statistical model can only provide general guidelines on the relationship between land use and beds supply.

		400
Practical implications: The survey clearly sho better in the areas with a balanced mix of sc	ows that the policies in favour of cenic beauties and high quality a	the development of agri-tourism could act agricultural products.

"I've learnt a ridiculous amount about myself" - Tourists' accounts of personal transformations

Xavier Matteucci Modul University Vienna, Austria xmatteucci@gmx.net

Session: QoL from the Perspective of Tourists

Keywords: the tourist experience, self-change, grounded theory, intangible heritage, flamenco

Structured abstract

Purpose of the study: This study investigates the nature of the tourist experience of intangible heritage. In particular, it explores in a holistic way how tourists experience flamenco music and dance courses in Seville, Spain.

Design/methodology/approach: Following a grounded theory research strategy (Charmaz, 2006), qualitative data were collected through in-depth interviews, photo elicitation, and participant observation. A total of 20 interviews were conducted with French and English native speakers in two distinct stages between September 2009 and May 2010. The interviews consisted of two parts: first a regular interview in the form of a conversation then followed by the use of images in a photo-interview (photo elicitation). The textual data derived from both in-depth interviews and photo-elicitation were analysed following a process of coding and categorizing the information.

Findings: At the core of the tourist experience of flamenco is the impact on the self. Personal growth was sought and experienced by the study participants in a variety of ways. Personal enrichment was felt by the informants as a result of their sometimes intense interactions with peers and instructors and the endurance of hardship. Together with personal growth, the informants reported transforming experiences. Two significant elements emerged: first, experiences were perceived as pivotal moments in people's lives such as rites of passage into adulthood for the youngest participants; second, experiences further enabled people to discover their authentic self. The respondents' deep involvement in the experiential dimensions of the flamenco activities closely resembles the experience of flow (Csiksentmihalyi, 1975) as well as the notion of 'existential authenticity' (Wang, 1999) which relates to the authentic inner experience that people feel while engaging in certain activities. As a result of their Andalusian peregrination, new horizons have opened up to them and in some cases new pathways and new careers have arisen. This study thus reveals that the creative experience of intangible heritage contributes to enhance the quality of life of those who engage in it.

Originality/value: The literature on the tourist experience highlights the dearth of studies on the personal factors, such as those related to the psyche and bodily feelings that contribute to the tourist experience (e.g. Crouch and Desforges, 2003; Gretzel and Fesenmaier, 2010; Veijola and Jokinen, 1994). This work addresses this gap. The fresh insights into the nature of the tourist experience should be valuable to both practitioners involved in customer experience management, and policy-makers seeking to sustain and valorise expressions of intangible cultural heritage.

Research limitations/implications: This research is context specific. Therefore, to achieve a greater understanding of tourists' consumption of intangible heritage, it would be useful to include a variety of informants interested in other forms of intangible heritage.

Practical implications: The findings point to a need to focus on cultural tourism strategies which aim at empowering both tourists and local talents in ways which would provide opportunities for learning and self-discovery. By adopting such strategies, the quality of life of tourists and locals alike is likely to be improved.

Tourism and the perceived quality of life of Sicilian residents. Evidences from a sample research

Antonino Mario Oliveri Università degli Studi di Palermo, Italy antoninomario.oliveri@unipa.it

Anna Maria Parroco Università degli Studi di Palermo, Italy annamaria.parroco@unipa.it

Session: QoL from the Perspective of Residents

Keywords: Quality of life, tourism, impact of tourism, hosts-guest relationship

Structured abstract:

Purpose of the study: The residents' attitudes toward tourism constitute a relevant component of tourism supply. This study investigates the relation between perceived impacts of tourism and residents' quality of life. The effect of some variables that influence perceptions and attitudes is measured as well.

Design/methodology/approach: Results from an in-progress sample research on 2500 Sicilian residents at the newly-instituted tourism districts are presented and discussed. Statistical multivariate models are fitted on data. Data are being gathered through both CATI and CAWI strategies. The distance decay (Jurowski & Gursoy, 2004) and the social exchange (Ap, 1992) theories are on the background. QOL is measured according to Andereck and Nyaupane's approach (2011).

Findings: Tourism affects quality of life in several ways and in both practical and perceived terms. Estimates of the impact of tourism on residents' QOL are referred to different touristic districts instituted by the Sicilian central administration. The mediating role of some variables on the relation between perceived impacts of tourism and QOL (length of stay, cognitive distance, social and economic exchange) (Rempel, 2012) is discovered and measured. The performances of different data gathering instruments in this specific field (mode effects) are assessed.

Originality/value: Few studies on the host-guest relationship have been carried out in Italy. This study has several strengths: it is the first on Sicilian touristic districts, and it has been financially supported by the European Union and facilitated by the Sicilian Regional administration. It consists of a large and recent research, carried out according to a proper random sampling design that allows us to quantify the errors of estimates.

Research limitations/implications: Data are gathered in Sicily; therefore results are referred to this Region, and might be used for different territorial contexts only for comparison purposes.

Practical implications: The research provides tourism district managers with valuable information about the residents' attitudes towards tourism. Decision makers might adopt proper policies and address tourist flows as a function of the deployment of socio-cultural resources.

Customer-to-customer interaction and its impact on event satisfaction

Linda Osti Free University of Bozen-Bolzano, Italy Linda Osti@unibz.it

Session: Social Relationships and Gamification

Keywords: Customer-to-customer interaction, event satisfaction, event experience

Structured abstract:

Purpose of the study:Research in tourism has highlighted that "when holiday makers' relationships are in difficulty and arguments prevail, the enjoinment of the destination is seriously compromised" (Parce and Maoz, 2008; cited in Pearce 2012), affecting, as a consequence, travellers' well-being (Pearce, 2012). This study aims to investigate the impact of customer-to-customer interaction on the final satisfaction with events. Other fellow attendees can affect event experience by influencing the atmosphere of the event and by engaging in personal encounters.

Design/methodology/approach: A quantitative approach was used: 435 event attendees were interviewed over a three-day period at a community festival in July 2011. Respondents were given a set of questions on their perception and attitude towards the behavior of other attendees and how this affects their final satisfaction. The questionnaire also included general questions on motives to attend the event, satisfaction with the event, and demographic characteristics.

Findings: The analysis shows the impact that customer-to-customer interaction and other attendees' behavior exert on general satisfaction with events. Other attendees not only affect satisfaction through direct interaction, they also affect the general atmosphere of the event through their behavior. The results of this study underline the importance for event organizers to control crowd behavior to create the correct atmosphere for the market target they want to attract.

Originality/value:

Most academic research in the tourism and event field has focused on satisfaction with the different features of the service; however only limited research has investigated the influence of customer interaction. This research work also analyses the influence of attendees' behavior on satisfaction.

Research limitations/implications: Data were collected only at one event. Future research should expand the data collection at other events and across other cultures.

Practical implications: The results of this study offer an insight to event managers on a specific feature of attendees' satisfaction.

The impact of landscape on farm-tourism demand

Linda Osti Free University of Bozen-Bolzano, Italy *linda.osti@unibz.it*

Marta Disegna Free University of Bozen-Bolzano, Italy Marta.Disegna@unibz.it

Francesco Marangon University of Udine, Italy Marangon@uniud.it

Christine Mauracher Università di Venezia, Italy Maurache@unive.it

Isabella Procidano Università di Venezia, Italy Isabella@unive.it

Stefania Troiano University of Udine, Italy Stefaina. Troiano@uniud. it

Session: QoL and Rural Tourism

Keywords: Farm-tourism, landscape, perception, visual pollution

Structured abstract:

Purpose of the study: This study aims to investigate the impact of landscape on farm-tourism demand. Natural and rural landscapes are an integral part of farm-tourism, however mankind is constantly modifying rural areas to make them more accessible, livable, profitable. Do new infrastructures spoil the attractiveness and competitiveness of the areas? Do tourists' expectations in terms of preservations of natural resources and need for relaxation and rejuvenation in an unspoiled environment collide with residents' needs for modern infrastructures and an improvement in their quality of life?

Design/methodology/approach: This research is based on the analysis of 229 questionnaires collected among farm tourists in the North-East of Italy. The survey included questions about the perception of how pleasant and unpleasant is the presence of natural and manmade elements in the surrounding landscape of the farm. A likert scale from 1 to 5 was employed.

Findings: The analysis identifies those elements of landscape that create nuisance and those that are considered pleasant in farm-tourism.

The results of this study underline the importance for land planners to consider landscape as an integral part of rural attraction and to carefully decide on how, and with what elements, to modify it in order to maintain rural areas more accessible and profitable for local inhabitants, but also more attractive for tourists.

Originality/value: Landscape is an element, which has been rarely evaluated in terms of its positive and negative effects on tourism attractiveness and destination competitiveness. As stated by Uysal et al. (2012), "The concepts of

destination competitiveness, sustainability, and QOL are intimately interdependent on each other and also conceptually and naturally linked" and these linkages need to be systematically examined. This study wants to fill a gap in the literature and focuses on a specific form of tourism: farm tourism.

Research limitations/implications: Data were collected only in two provinces of the North East of Italy and the sample size comprises only 229 valid responses. This best practice paper offers a first insight into the topic.

Practical implications: The results of this study can provide land planners with a valid overview of the importance of proper landscape planning if tourists want to be attracted.

Decision Making for Well Being: Do Belief Functions Preserve Decision Heuristic Biases?

Donald Lee Pardew Free University of Bozen-Bolzano, Italy DonaldLee.Pardew@unibz.it

Serena Volo Free University of Bozen-Bolzano, Italy SVolo@unibz.it

Session: QoL from the Perspective of Tourism Industry

Keywords: Belief Functions, Decision Heuristics, Decision Bias, Well Being, Life Quality

Structured abstract:

Purpose of the study: Leisure travel, typically undertaken once per year as relief from employment, is recognized as contributory to life quality. Biased travel decisions can result in quality of life opportunity costs. It is important to understand the sources of these costs and how they can be mitigated.

Design/methodology/approach: Within subjects design: 50 adults were presented, sequentially, with two tasks concerning a choice of travel alternatives. The first set solicited their judgment about a feature of the alternatives using explicit and implicit judgment-biasing information. The second asked them to form a belief about the alternatives using the first set plus additional plausible or contradictory information. Then the preservation of judgment biases were tracked forward.

Findings: Travel related judgments and decisions were demonstrated to be susceptible to a wide range of decision and judgment heuristic biases. As expected, the susceptibility depended to a significant degree on the availability of corroborating or contradicting information. Judgment biases were observed to be preserved and represented in subjects' subsequent formulation of belief functions, but depended on the starkness and credibility of the second set of information and, if probabilistic, how the information was represented. However, initial, biased judgments formed in the first judgment task showed a general preservation when the information was migrated forward into a "alternative selection" decision.

Originality/value: Two lines of scientific inquiry that have recently acquired much experimental and theoretical attention and credibility and hold potential for improving quality of life type decision making: Behavioral economics, viz., decision heuristic biases; and statistical belief functions. These two theoretical areas are not adequately integrated. Belief functions are suspected of being susceptible to decision heuristic biases. The present research evaluates the suspicion and relates it to quality of life decisions.

Research limitations/implications: The scenarios constructed, and about which subjects were asked to formulate judgments and beliefs, were fictional, and it can be argued that subjects would behave differently if judging an actual travel decision.

Practical implications: Travel decisions and purchases must typically be made in advance of consumption, and judgment biases surely come into play. Awareness of such biases can improve travelers' decision making and lead marketers to responsibly communicate offerings.

Joyful destinations: The governance of quality of life

Harald Pechlaner EURAC, European Academy of Bozen/Bolzano, Italy harald.pechlaner@eurac.edu

Michael Volgger EURAC, European Academy of Bozen/Bolzano, Italy michael.volgger@eurac.edu

Sabine Pichler EURAC, European Academy of Bozen/Bolzano, Italy sabine.pichler2@eurac.edu

Session: QoL and Gourmet Tourism

Keywords: governance, quality of life, integrated location management, South Tyrol

Structured abstract:

Purpose of the study: The objective of the study is to understand which strategies and organizational patterns are needed to effectively manage QOL in tourist destinations. In particular, the paper analyzes how the interfaces between different target groups and the public and private spheres are managed in South Tyrol.

Design/methodology/approach: A qualitative research design was followed. Data were gathered through qualitative indepth interviews and analyzed with the GABEK/WinRelan tool. The analysis process was based on a rule-guided development of networks of keywords, which are capable of summarizing the content of the interviews in a comprehensive way.

Findings: In South Tyrol, the governance of QOL is carried out by four relatively autonomous organizations (SMG, BLS, TIS, EOS). Each of these has a clearly defined scope of duties and is oriented towards a unique target group. Notwithstanding their different task profiles, these organizations collaborate intensively in order to promote QOL in South Tyrol in a holistic manner and to satisfy the partly overlapping requests of the various target and stakeholder groups. Therefore, they developed specific interfaces. For instance, SMG is increasingly concentrating its tourist promotion on the (innovative) clusters identified by TIS.

Originality/value: While a considerable number of studies have put under scrutiny the object (the 'what') of QOL research (QOL indicator sets, soft locational factors, sustainability), issues regarding operationalization and application (the 'how') have remained largely untouched. This means that especially from an organizational point of view it is still unclear how territorial units such as tourist destinations can effectively manage the public good 'quality of life'.

Research limitations/implications: The "South Tyrolean model" of governance of QOL separates tasks and target groups and allocates them to autonomous organizations. Additionally, these organizations are rooted in three different provincial ministries. Synergies are realized in a second instance.

Practical implications: A stronger integration of the South Tyrolean core competences (themes) with territorial units such as destinations seems to provide further potential to strengthen the synergies within this South Tyrolean model of QOL governance.

Identifying Segments for Wine Tourism Activities in Südtirol/Alto Adige

Günter Schamel Free University of Bozen-Bolzano, Italy guenter.schamel@unibz.it

Session: QoL and Gourmet Tourism

Keywords: wine tourism, wine knowledge, segmentation

Structured abstract:

Purpose of the study: Objective is to determine the relevance of wine tourism in Alto Adige and to define characteristics of relevant visitor segments interested in wine tourism activities. Based on the findings, we derive recommendations how to foster the importance of wine tourism throughout the region.

Design/methodology/approach: Using a mixed online/offline survey, we define three relevant segments for wine tourism in Alto Adige: wine connoisseurs, gourmet travelers and ordinary wine drinkers. Gourmet travelers and wine drinkers are determined by self-assessment while wine connoisseurs are defined by asking them about their wine knowledge. Using the data collected, we post a series of hypothesis on the potential for wine tourism in Alto Adige.

Findings: The results of the statistical analysis reveal that wine connoisseurs have a detailed and significant knowledge about the wines of Alto Adige and that wine is a significant motivation in their decision to visit a destination. Moreover, they repeatedly visit Alto Adige and enjoy its wines during their stay as well as upon their return home. Gourmet travelers drink more wine from Alto Adige during their stay but do not know more about the region's wines than other guests. Wine drinkers who regularly consume wine during their stay are also buying Alto Adige wine while on vacation and at home.

Originality/value: The study is a unique effort to characterize tourists visiting Alto Adige with respect to their wine knowledge, consumption behavior and the importance of wine in their destination decisions. We are able to show that both wine connoisseurs have significant knowledge about Alto Adige wine while gourmet travelers do not. Therefore, any strategy for future wine tourism activities would have to differentiate between them as prime target groups.

Research limitations/implications: We present a first attempt to obtain a more differentiated picture of the wine tourism potential in Alto Adige. Future research is needed why gourmet travelers have only limited knowledge about Alto Adige wines.

Practical implications: The study shows that wine tourism strategies could target wine connoisseurs as premium customers for local wineries as well as gourmet travelers for educational activities to further their knowledge about local wines.

Tourist's quality of life as an aggregate of tourist's perceived values over time

Regina Schröder Free University of Bozen-Bolzano, Italy regina.schroeder@unibz.it

Session: QoL from the Perspective of Tourists

Keywords: quality of life, tourist's perceived value, aggregation, interrelations

Structured abstract:

Purpose of the study: Scholars have discussed various conceptions of customer value. It remains, however, unclear how tourists can evaluate their long-term quality of life (QOL). This paper contributes to closing the established gap, by proposing a newly conceptualized model, taking dependencies among quality evaluations and objectives into account.

Design/methodology/approach: Starting from the magic triangle summarizing tourist's objectives, this paper firstly presents multiple types of interrelations. Secondly, it elaborates on the developed aggregation procedure evaluating the QOL. Assuming the tourist potentially possesses one experience, with which the aggregation procedure begins, the probabilities attached to gaining other experiences change. Having considered all changes, the aggregated QOL can be calculated, and the procedure be compared and evaluated.

Findings: The proposed model proves Aristoteles' presumption ("The whole is more than the sum of its parts.") to be true: A tourist's QOL does not necessarily agree with the sum of his single quality evaluations over time. Rather, it may obtain a higher or smaller value. This is due to the dependencies considered.

The model discussed proves itself reliable, because a repetitive calculation, assuming the same quality evaluations and interrelations, leads to the same result.

The findings have, however, to be considered with all due care, because they abstract from the time factor, i.e. changes in the dependencies are not considered.

Originality/value: Proposing a framework for evaluating tourist's QOL, this paper paves the way for integrating newly developed and/or adjusted instruments and/or ratios in (management) accounting, in particular methods considering the time factor.

It also offers a possibility to appraise the effects of repeated experiences and of learning effects on the tourist's perceived QOL.

The paper will hopefully stimulate a debate on the necessary and sufficient conditions of a quality aggregation procedure.

Research limitations/implications: Referring to the tourism sector, hospitality-oriented objectives should be applied, i.e. the magic triangle should be reformulated. To evaluate the proposed model, new controlling instruments need to be developed, offering opportunities for future research.

Practical implications: As the conceptualized framework has not been applied in practice yet, it awaits its implementation and testing, amongst others with the objectives of identifying any failures or impracticalities made and of thereupon enriching the model.

Applications and impacts of gamification in tourism

Marianna Sigala University of the Aegean, Greece m.sigala@aegean.gr

Session: Social Relationships and Gamification

Keywords: gamification, tourism, applications, impacts, customer engagement

Structured abstract:

Purpose of the study: Gamification is the application of game-play mechanics for non game-applications. Although gamification is used in tourism, research investigating the use and impact of gamification in tourism is scant. By adopting a case study approach, the study investigates the exploitation and impacts of gamifiation in tourism.

Design/methodology/approach: Four major gamification applications in tourism (IrelandTown, AustraliaFacebook, wineguru, lufthansawefly) are used as study cases for analysing their "funware" design and game mechanics and then, analysing the latter's influence on tourists' behaviour. Game mechanics are classified according to Xu's (2011) taxonomy (behavioral, feedback, progression), while game theories are also used for developing appropriate hypotheses about the impact of various game elements on tourists' behaviour. Gamification has been applied in many disciplines (e.g. education, research, business) for helping users to achieve better results (e.g. higher productivity, learning abilities and knowledge acquisition) in a more enjoyable and engaged way. Customers use e-business settings, because they seek both utilitarian (e.g. search efficiency, facilitation of decision making) and hedonic (e.g. self-actualisation, self-promotion, fun, exploration of new ideas, follow the fashion) benefits. In this vein, the gamification of e-business practices can help users to better meet all their needs (e.g. physical, social, personal) and improve their quality of life.

Findings: Gamification is successfully applied in several websites for creating loyalty, brand awareness and effective marketing engagement. The case studies have shown that successful gamification applications should adopt game mechanics that allow the combination of extrinsic and intrinsic motivation in order to optimise customer engagement, users' flow and task involvement. By increasing users' involvement and social interaction, gamification benefits not only the firms but also the users by meeting their higher order and social needs. Findings also show how gamification can be used by tourism firms for innovating their online business models and enhancing customer relationship management.

Originality/value: Gamification is extensively studied in fields like education, simulations and military applications. Gartner predicts that by 2015 more than half firms will apply gamification principles in their business practices, but research into gamification and tourism is scant, while research about gamification in the business field is currently developing. This study contributes not only in tourism research, but also in the business management field whereby research into gamification is currently under-developed.

Research limitations/implications: The study applies a case study methodology and so a larger scal stuy is required in order to replicate and refine findings in other contexts and generalise results

Practical implications: The study provides useful theoretical implications about the impact of gamification on tourists' behaviour. The study also gives numerous practical guidelines on how to design tourism gamification applications for enhancing customer loyalty and relations.

Vacation and quality of life: Testing comprehensive congruity model

Oksana Tokarchuk Free University of Bozen-Bolzano, Italy oksana.tokarchuk@unibz.it

Michael Bosnjak Free University of Bozen-Bolzano, Italy michael.bosnjak@unibz.it

Oswin Maurer Free University of Bozen-Bolzano, Italy oswin.maurer@unibz.it

Session: QoL from the Perspective of Tourists

Keywords: congruity, self-congruity, probit, quality of life

Structured abstract:

Purpose of the study: Present study investigates the influence of a comprehensive congruity model developed in Bosnjak et al. (2011), vacation-related variables and demographic characteristics on the perceived enhancement of quality of life by the visitors to Tasmania region.

Design/methodology/approach: The analysis is performed on survey data collected in 2011 from 302 recent visitors to Tasmania. With the help of exploratory factor analysis main factors that compose the congruity model are defined. Next, multinomial probit analysis defines the influence of congruity model on the perceived improvement of the quality of life. Other information about the trip and demographic characteristics are used as control variables.

Findings: Exploratory factor analysis shows that 7 factors model is compatible with observed data. We observe leisure factor to be the most important factor, which is followed by functional and economic factors. Self-congruency was the least important factor, while visitors were not influenced by moral concerns. All factors have significant positive impact on the perceived enhancement of quality of life derived from the vacation, except for hedonic considerations. We identify a set of vacation-related variables, like duration of stay, type of accommodation, and demographic characteristics, that have impact on the improvement of quality of life.

Originality/value: Previous research on quality of life in the domain of travel and tourism concentrated on the effect of satisfaction with travel/tourism services on visitor's quality of life. Present study is the first study that explores comprehensive congruity model in the domain of quality of life research. This model demonstrated high predictive power for post-visit loyalty judgments. We confirm this finding in the domain of quality of life research.

Research limitations/implications: Our study is limited to one concrete destination, which is Tasmania region in Australia. Comparison between different destinations would shed more light on the factors that influence enhancement of quality of life derived from vacation.

Practical implications: Our study identifies a set of variables that practitioners of destination management should use as guidelines on how to improve positioning of the destination and to improve destination image.

Revealing the influence of managerial practices and entrepreneurs' characteristics on hotel efficiency

Enrico Tundis University of Trento, Italy enrico.tundis@unitn.it

Marco Corsino University of Bologna, Italy corsino.marco@unibo.it

Enrico Zaninotto University of Trento, Italy enrico.zaninotto@unitn.it

Session: QoL from the Perspective of Tourism Industry

Keywords: Efficiency, DEA, Two-stage estimation, Hotel industry, Managerial practices

Structured abstract:

Purpose of the study: The study looks at which factors explain the observed heterogeneity in efficiency levels across hotels. It distinguishes the effects of both entrepreneurs' traits and hotel management practices on hotel efficiency from the overall influence of contextual (destination) factors.

Design/methodology/approach: Two-step approach to the study of efficiency. First step: a metafrontier approach in the Data Envelopment Analysis (DEA) framework to control for the specific environmental conditions which each hotel faces and to isolate the part of efficiency which is more correctly related to factors under management control. Second step: bootstrapped regression of residual efficiency on a set of proxy of managerial practices.

Findings: The study shows that, despite the variety of patterns of demand and competitive environment, destination explains only a small fraction of productive efficiency. When firm-level variables are considered, some behavioral variables turn out to play an important role: they include investment behavior, which is particularly important, and family management, which negatively affects efficiency. Moreover, the results confirm that a strongly conservative attitude toward technology is associated with low productive performance. Finally, entrepreneurs' characteristics seems to play a minor role.

Originality/value: The study contributes to the limited literature on how managerial practices, entrepreneurs' characteristics and investment choices influence the observed heterogeneity in efficiency scores among hotels. Moreover, the exploration based on a large, representative sample of hotels reduces issues of potential selection bias and considerably improve the internal validity of the analysis.

Research limitations/implications: The empirical setting of this analysis is the Province of Trento. As such, generalizations to the entire hotel industry of the findings should be made with caution at this stage of the research.

Practical implications: The study offers some insights for managers and public policy-makers in designing performance improvements. The study supports the view that there is room for improvement inside each destination, considering the relevant internal hotel factors.

Prospects of sustainable tourism development in historico-cultural destinations - the example of the Epidaurus Festival

Gernot Wolfram MHMK Berlin, Germany *GernotWolfram@gmx.de*

Sebastian Kaiser SRH Heidelberg, Germany sebastian.kaiser@fh-heidelberg.de

Session: QoL from the Perspective of Residents

Keywords: cultural tradition, sustainability, tourism, body experience

Structured abstract:

Purpose of the study: By taking the example of the Epidaurus Festival at the ancient theatre and the sanctuary of Asklepios at Epidaurus/Greece the research project aims to identify and critically reflect on the prospects of a modern approach to sustainable creative tourism development in historico-cultural destinations. Furthermore is the discourse about identity and cultural recognition in this context reflected as a philosophical approach to quality of life discourses.

Design/methodology/approach: Initially a hermeneutical analysis of positions of cultural sciences, esp. referring to body and space experience during greek antiquity, has been made (comp. Sennett 1995, Schroer 2005). Secondly indepth interviews have been conducted with representatives from the municipality of Epidauros, the Festival of Epidauros as well as Imalis, a research and training center dedicated to the study of the performing arts in the Ancient Hellenic tradition. Comparing ancient ideas to present concepts of identity via dance and sport expressions with the current Imalis concept of creating a new meeting point for creative tourism in the region leads to a placing of this project within quality of life discourses.

Findings: The (re-)invention of event formats as in the case under consideration, based on active participation as well as body experience in the tradition of Greek antiquity, offers a new approach to historico-cultural destinations. The results of the study clearly indicate that if strategically chosen as a point of reference such formats may reveal prospects of sustainable creative tourism development as they both have the strength to activate and stimulate spectators and participants with different cultural and social backgrounds as well as the ability to reach consensus among the stakeholders, including the local population. (comp. Richards; Wilson 2008; Wolfram 2012)

Originality/value: The originality of the paper lies in the exemplary description as well as critical reflection of the prospects of an innovative, participatory approach to sustainable creative tourism development. Based on the ancient Greek tradition of cultural experiences the revival and reinterpretation of the relevant event formats can be interpreted as a "vital act of remembrance and creation", based on a completely different narrative as proposed by conventional touristic offerings.

Research limitations/implications: The study is limited to the analysis of a particular example case, in combination with a profound theoretical background as well as qualitative interviews, however.

Practical implications: A theoretically and empirically based understanding of the current practice in the case under consideration allows the discussion as to how far the concept might be transferred to other venues with similar historico-cultural background.
